

# OctaMon+

One-of-a-kind  
wearable &  
customisable  
8-channel fNIRS

The OctaMon+ opens the possibility to measure at any position on the scalp. We have developed interchangeable high-power and lower-power optodes with our own 3-step mechanism that enables you to easily select the pressure load on the optode. This has a clear advantage over spring-loaded systems with a fixed and often too tense load. This system also allows you to easily part the hair beneath the optode. As a rule of thumb, you can use high-power optodes on any template covered by hair, and low-power optodes on hairless areas. This way, we created the perfect and portable 8-channel system capable of measuring from prefrontal lobe to occipital lobe with the highest possible signal quality.

8-channels and truly portable.

Utilizing the non-invasive NIRS technique.

Can be combined with other techniques such as EEG, EMG, and tCS.

Measures oxy-, deoxy-, and total hemoglobin concentration changes.

Easy data analysis with our superior analysis software OxySoft.
